## 360° Situational Awareness Visioning System

# 360° Situational Awareness Visioning System

The 360-Degree Situational Awareness System is an integrated imaging system, incorporating multiple products to form a comprehensive vision. It has been developed with the primary objective of augmenting situational awareness for tactical armored vehicles and personnel, thereby enabling the implementation of necessary precautions.

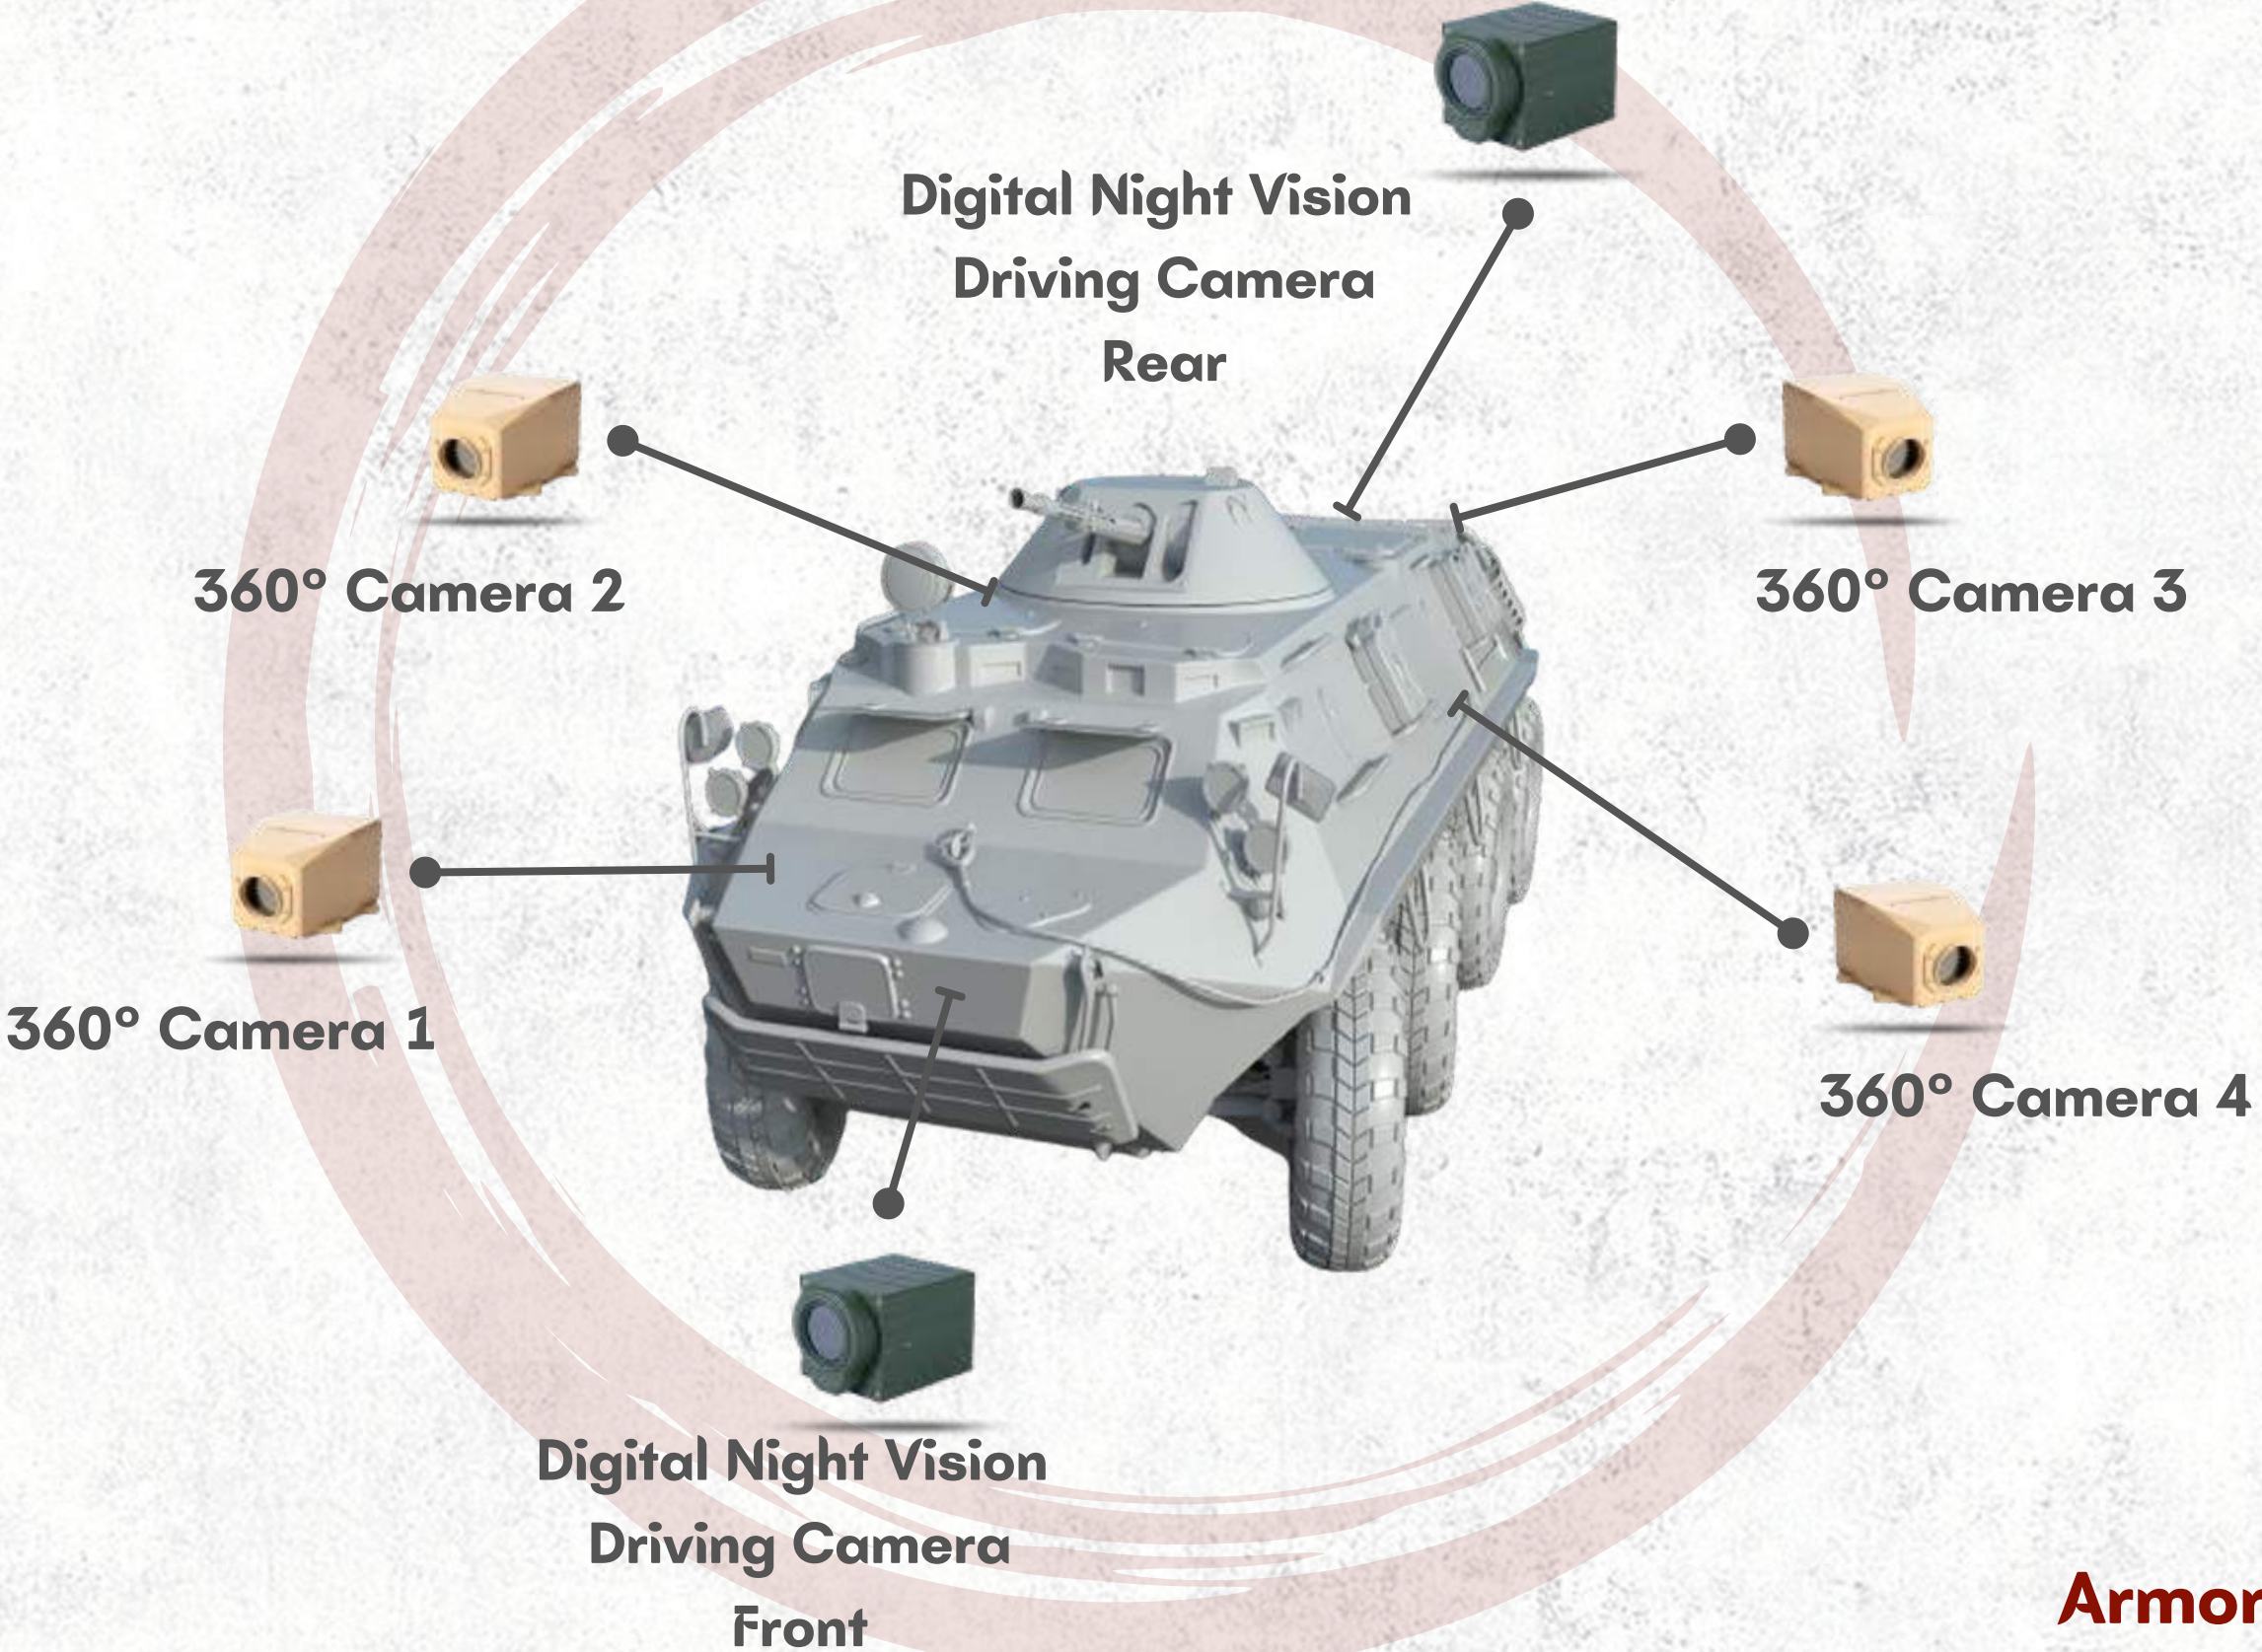

The system affords a 360-degree range of awareness, providing vehicle crew members with surveillance and navigation capabilities under both day and night conditions. If required, it can also be integrated with medium-to-long range reconnaissance and surveillance systems installed on platforms for border or critical area security purposes. This versatile system is designed to cater to a broad range of situational needs in diverse operational environments.
