

# Cross-Border Operation *Retina*

Cross-border operations do not have a fixed surveillance infrastructure. That's why Retina is designed for use beyond borders. With its tethered structure, the drone can be raised up to 100 meter height, stays in the air for an unlimited time, and the surveillance beyond the border is never interrupted. In addition, data that cannot be jammed thanks to its tethered structure can be transferred to the command & control center via SATCOM if desired.
